

# Installation

The install scripts already install ROS for you, these instructions are if you wish to manually install ROS.

For Ubuntu 14.04, you can just follow the normal [ROS installation instructions](#).

For Linux Mint 17.x, the instructions are mostly the same, here are the steps (derived from <http://insane-on-linux.blogspot.com/2014/10/installing-ros-indigo-on-mint-17.html>):

```
sudo sh -c ' . /etc/lsb-release && echo "deb  
http://mirror.umd.edu/packages.ros.org/ros/ubuntu trusty main" >  
/etc/apt/sources.list.d/ros-latest.list'  
wget https://raw.githubusercontent.com/ros/rosdistro/master/ros.key -O - |  
sudo apt-key add -  
sudo aptitude install ros-indigo-ros-base
```

## Errors and Known Solutions

If you get the following error:

```
ImportError: "from catkin_pkg.package import parse_package" failed: No  
module named catkin_pkg.package
```

Make sure that you have installed “catkin\_pkg”, it is up to date and on the PYTHONPATH:

```
$ pip install catkin_pkg
```

---

Error:

```
ImportError: No module named rospkg
```

Fix:

```
$ apt-get install python-rospkg  
$ export PYTHONPATH=$PYTHONPATH:/usr/lib/python2.7/dist-packages
```

This is kinda a hack, haven't bothered to figure out how to properly install python-rospkg to the proper python location for indigo

---

If you get this error:

```
ERROR: the following packages/stacks could not have their rosdep keys
```

resolved to system dependencies: ardroner\_autonomy: Unsupported OS [mint]

when running any rosdep command, add the flag `--os=ubuntu:trusty` to the command.
